

# Fire Suppression System (FSS)

## HOW DOES IT WORK?

F.S.S. is unique. No other dryer has such a controlled extinguisher system giving total peace of mind. F.S.S. detects a fire in the dryer while the machine is idle (spontaneous combustion) or while the tumbler is drying, usually when small loads are over-dried. In both cases the fire is extinguished in seconds.

- Water is atomised into a vapour that douses the fire and starves it of oxygen.
- The drum rotates every 15 seconds to ensure that all of the laundry in the drum is 'wetted out' and all parts of the fire are extinguished.
- F.S.S. is in operation for 2 minutes. After this time, it continually monitors and restarts if a fire is detected again.

## The Milnor FSS Advantages.

- Doesn't flood the basket.
- The system will continue to activate until temperature is reduced signaling the fire is extinguished.
- Minimal damage, if any, to the dryer, surrounding laundry equipment and building.
- Very easy clean up.
